

PNS PRO IA
G-CAMDRAW

Tool that synchronizes a map with PTZ cameras, to know their position and field of vision in real time, as well as manage their movements through the map.

G-CAMDRAW

Tool developed by F.F.Videosistemas integrated in Geutebrück recorders for compatible PTZ cameras that allows:

To synchronize and visualize one or several cameras on maps:

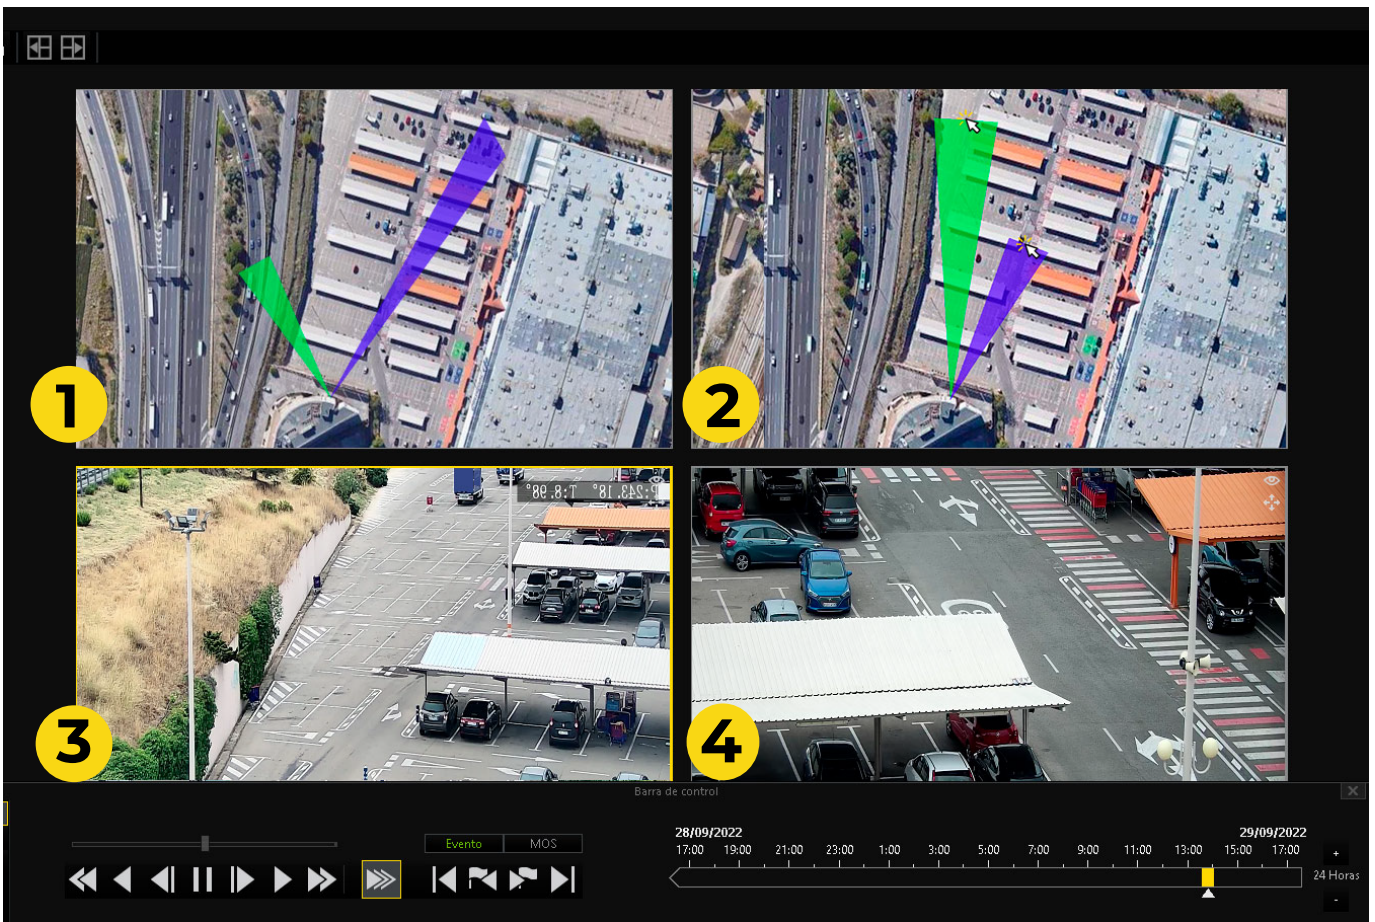

camera position changes that occur when executing a preset, moving the camera, tracking, joystick movement, etc. are represented on the maps in real time, visualizing their field of view in a realistic way.

To manage the movement of the camera(s) across the map: by clicking on the desired point on the map, camera will automatically move to the selected point, adjusting its zoom and position.

To add representative icons on the map, whose purpose is to inform in a visual way of different events relevant to the guard, such as: a fire, a low barrier, an intrusion, etc.

In the first image we can see the map and, represented in green and purple, the field of view of the cameras according to the selected focal length.

The second viewer shows the movement of the selected camera by double clicking on the map.

Viewer 3 and 4 show the real-time images of the cameras represented in map 1.
